

Setting up File sharing in windows

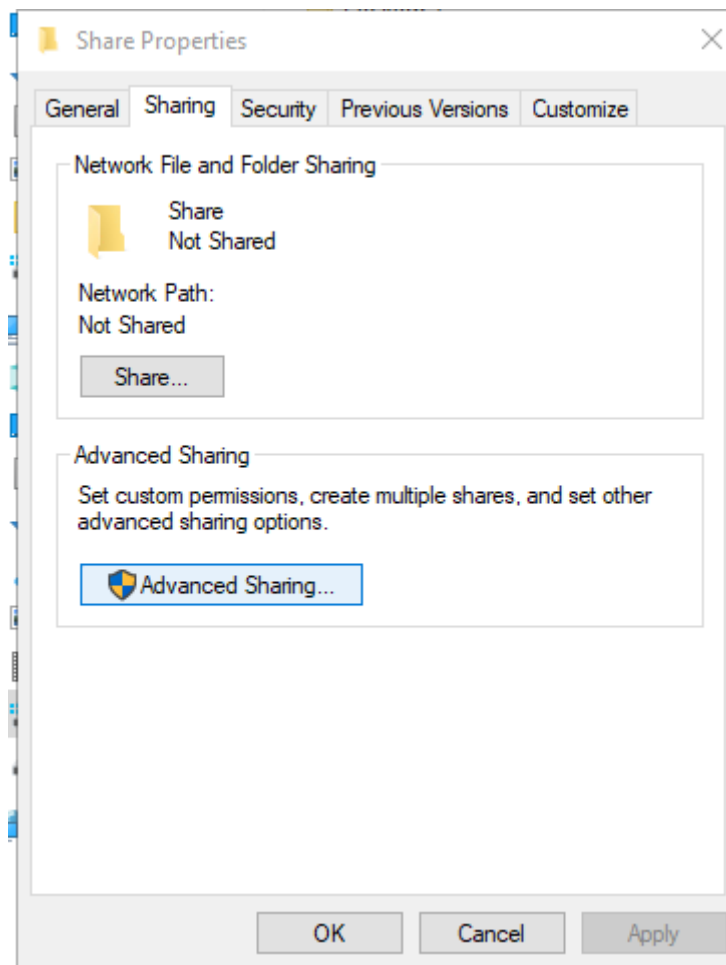

Step 1 - Selecting directory

- Once you have created the needed users and groups, you can move forward to set up the Windows file share:
- Select the directory you want to share or create a new one. In this example, the newly-created directory has the following path: C:\share
- Right-click the directory folder and choose Properties from the context menu.

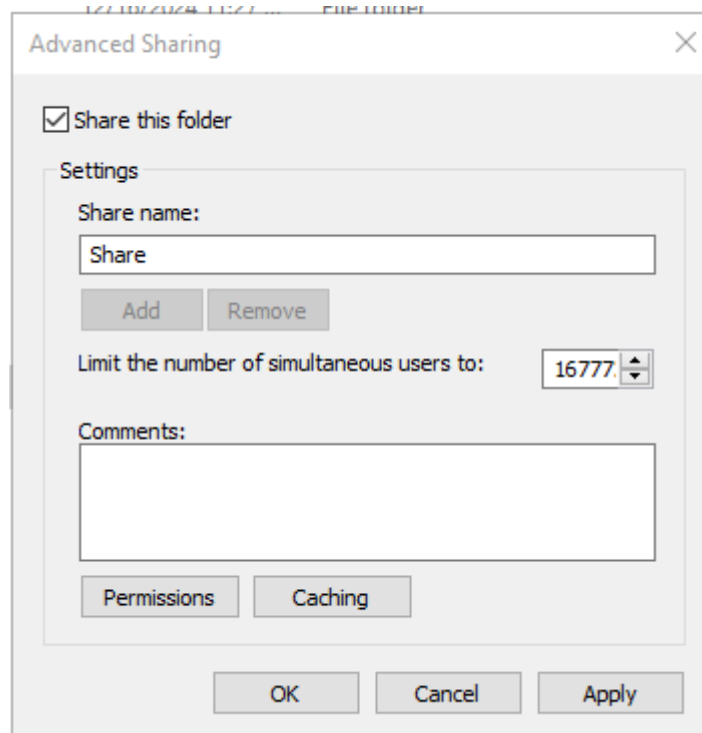

Step 2 – Configure sharing permissions: Access Advanced Sharing

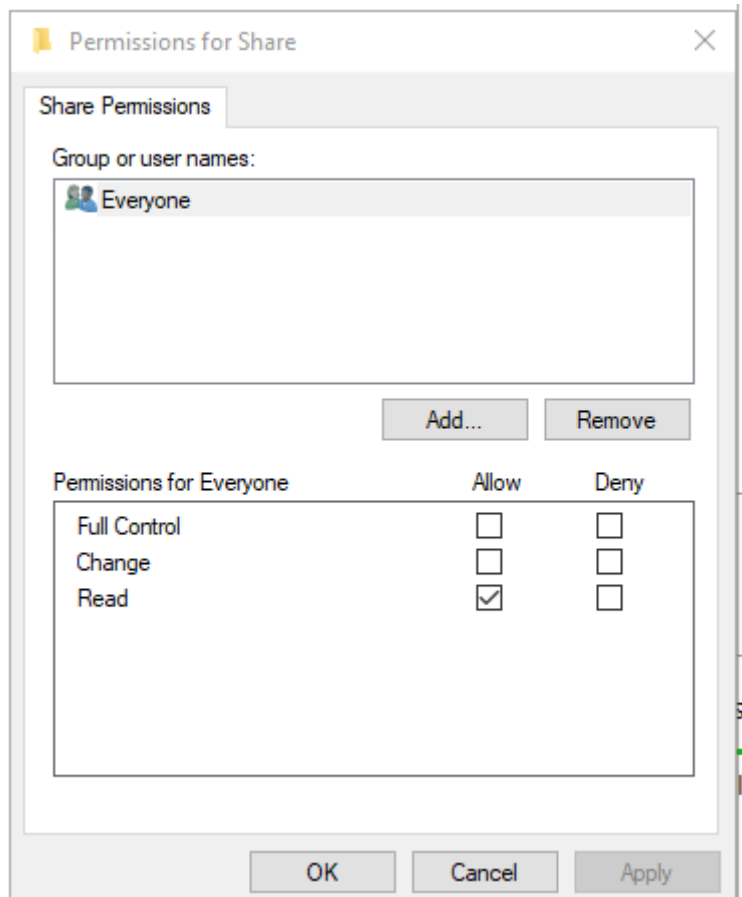

- Now you should set up sharing permissions by following the steps below:
1. In the Properties window, select the Sharing tab and click the Advanced Sharing button.

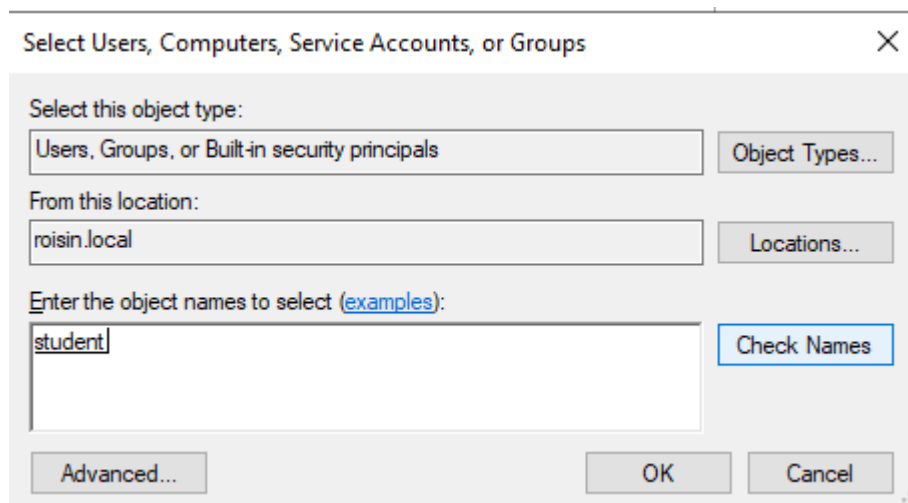

2. Select the Share this folder checkbox in the Advanced Sharing window then click Permissions.

- As you can see in the Permissions for share pop-up, Everyone can read the contents of the shared folder. Everyone is the default group that includes all users on the current computer. In this example, Everyone is removed by clicking on it then on Remove since a custom configuration is created.

- Click Add to select the users and groups that will be allowed to access the file share.

Select check names when the name appears

- Click advanced

Select Users, Computers, Service Accounts, or Groups

Select this object type:
Users, Groups, or Built-in security principals

From this location:
roisin.local

Step 3 - Share the folder on network

- Find the name of your server

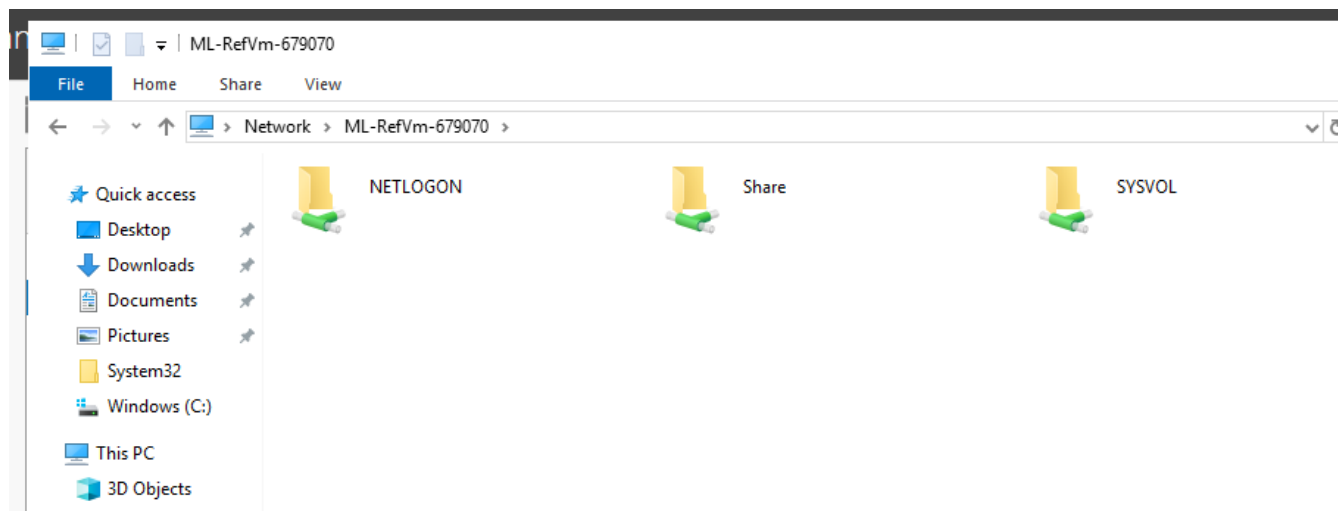

● **SCREENSHOT THIS**

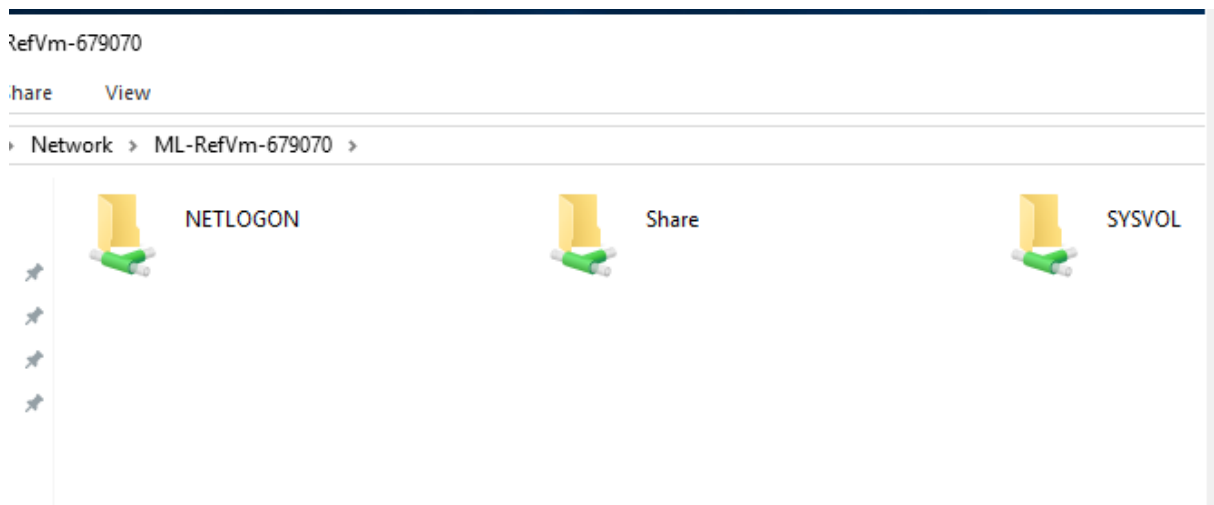

Go to the file explorer and put <\\ML-RefVm-679070> in the URL.

You share folder should appear. If it does not appear you need to click the yellow bar allowing the network to be shown

SCREENSHOT THIS

- Click into the share folder you should be able to access it because you have given the student user share permissions
